All headless web projects require hosting. Launch is a framework-agnostic hosting solution that is part of the Contentstack platform. It is a great solution for lightning-fast web experiences and is pre-integrated into Contentstack's CMS.

- Launch is a platform that hosts and deploys websites developed using the Contentstack CMS. By creating a project in Launch and connecting it to your GitHub repository, you can simplify your web development workflow. Launch efficiently selects the code from your repository and promptly deploys your website, resulting in no downtime.
- To enhance your projects' functionality and facilitate testing and debugging, Launch enables you to incorporate custom domains, serverless functions, and environment variables.
- Moreover, Launch seamlessly integrates with Automation Hub, offering triggers and actions for various Launch operations. Additionally, Launch provides deploy hooks functionality, enabling you to initiate rebuilds by accessing a specific URL.

Note: To create and launch a project in Contentstack, please ensure that you have the necessary permissions within the Contentstack organization. Specifically, you must be assigned either the "Admin" or "Owner" role in the organization.

Launch can be found in the leftmost navigation at the organizational level in Contentstack.

Stacks

Launch **L**

Welcome to ≋ CONTENTSTACK

A stack is a space that holds content and settings related to a project. You can create separate stacks for different projects.
